WOW

Is this your first time seeing core glow?

Use the UV light for a quick burst of glow. For a full charge place in the sun or under a bright light for about half an hour for a glow that lasts all night long.

HOW

core glow works by the process of photoluminescence. Light energy in the form of photons is absorbed into the crystal field of the core glow molecule. These photons are gradually released at a lower energy state which accounts for the colour change and long lasting glow. This emission is the light that you see when the core glow is charged.

You will notice that after a full charge your Core Glow will dim over time until the next charge. We call this the 'glow cycle'.

First hour: ultra-bright glow burst

Second to third hour: strong glow

Third hour to tenth hour: ambient glow

To best view your glow turn off all of the lights. Give your eyes time to adjust to the darkness, and you will be amazed by the gentle glow.

IDEAS

leave a trail for someone to follow

make a galaxy in your room, in
your garden, in your driveway

give one to a friend

best dance floor ever

...

(send us your best ideas)

electricity-free lighting

please recycle this bag and packaging

Thank you, and enjoy your glow!
